

Consiva Onboarding Assistant — Chatbot Knowledge Base

This document is built from Consiva's real "Your first 15 minutes on Consiva" walkthrough. Paste the **System Prompt** section into your chatbot builder as-is, and use the **Stage Reference + FAQ + Troubleshooting** sections as the bot's knowledge base / retrieval content.

SYSTEM PROMPT (paste this into your chatbot)

You are the Consiva Onboarding Assistant. Your job is to guide users step-by-step through setting up their Consiva account, based on their current onboarding stage (signup → email verification → domain setup → script install → banner design → consent tracking → forms → billing → grievance officer → security → support).

Rules: - Ask the user which step they're on, or infer it from what they describe (e.g. "my domain won't verify" = Step 4). - Give only the relevant step's instructions — don't dump the whole 12-step flow unless asked for an overview. - Always name the exact menu path (e.g. **Domains → Add Domain**) and the exact button/label the user should click. - Keep responses short, clear, and professional. Use numbered steps for anything with more than one action. - If a step involves a script, give the script/snippet format described in the reference, but tell the user their actual key/domain-ID will be unique to their account — don't invent one. - For unresolved issues after basic troubleshooting, direct the user to **Help & Support → New Ticket** and tell them response time depends on the priority they select. - Never guess at product behavior not covered in the reference material below. If you don't know, say so and point to New Ticket.

STAGE REFERENCE (12 steps, in order)

1. Create your free account

Go to consiva.ai/register. Fill in First/Last Name, Organization Name, Email, Password (needs uppercase, number, special character). No credit card required — every account starts on Free.

2. Verify your email

Click **Verify** next to the email field. A 6-digit code arrives by email within seconds. Enter it — the badge turns green inline (no separate page), and you can't create the account until it's verified.

3. Add your first domain

Go to **Domains → Add Domain**. Enter: - Domain Name - URL - Optional description - Verification Method (DNS TXT Record / HTML Meta Tag / File Upload)

4. Verify domain ownership

Right after adding the domain, Consiva shows exactly what to publish:
- **DNS TXT Record** (default) — add a Host + Value TXT record to your DNS - **HTML Meta Tag** - **File Upload**

Not technical? Use the “**share these steps with your IT/dev team**” box inside the dialog — it emails the developer the exact host/value. Once live, click **Check Now**. DNS changes can take a few minutes to propagate before the check succeeds.

5. Install the consent script

Once the domain is verified, its row shows a **Script** action. Tabs for **HTML / WordPress / Shopify**. Example (HTML):

```
<script
  src="https://[your-instance]/sdk.js"
  data-domain-id="YOUR-DOMAIN-ID"
  data-api-url="https://[your-instance]"
  async>
</script>
```

Paste before any other tracking scripts, in the site's <head>. This snippet renders the banner, blocks tracking scripts until consent is given, and reports every decision back to Consiva. The domain's actual Script Key is shown in-app — always pull the live one from the user's own dashboard, don't reuse an example key.

6. Design your cookie banner

Go to **Banner Builder**, pick the domain. Edit Title, Description, button labels (Accept/Reject/Preferences), and Layout (Bottom Banner / Top Banner / Modal / Floating Widget). Live preview updates as you type. India-facing sites get a prompt to add an Eighth Schedule language alongside English (DPDP Section 5(3)) — e.g. Hindi, Tamil, Bengali.

7. Review cookie consent activity

Cookie Management is the audit trail — every Accept/Reject/Withdraw is logged with domain, country, and timestamp (tamper-proof). Run **Scan** from the Domains page anytime to auto-discover new cookies.

8. Capture consent on forms

Consent Management tracks consent on Contact Us, Enquiry, and Chatbot forms — each record has cryptographic proof it wasn't altered. Click **Get Script** for a two-step snippet: 1. Tag PII inputs with data-cmp-pii="ColumnName" 2. Attach one submit handler — new tagged fields are auto-captured later, no JS changes needed.

9. Choose your plan

Settings → Billing shows current usage vs. plan limits. - **Free**: 1 domain, 1,000 cookie consents/mo, 50 form consents/mo, DPDP banner (English + Hindi), basic scanning, 30-day analytics, 1 onboarding session - **Pro** (₹5,999/mo): 5 domains, 15,000 cookie consents/mo, 1,500 forms/mo, scheduled scanning, DPDP+GDPR banners, 22 Eighth Schedule languages, exportable analytics, CERT-In breach tracker - **Enterprise**: Custom — unlimited domains, data discovery, ROPA auto-generation, multi-framework (DPDP/GDPR/CCPA), full CERT-In breach module

10. Add your Grievance Officer

Under **Settings**, add the Grievance Officer's name, email, and response SLA (DPDP requires this contact be published). It auto-appears in the banner's preferences panel. There's also a Data Protection Officer section (DPO email, Breach Notification SLA, CERT-In SLA hours, ICT log retention days). A verified domain missing a Grievance Officer shows a warning nudge on the Domains page.

11. Secure your account

Settings → Security: change password (live strength check). Right next to it, enable **Two-Factor Authentication** — adds an authenticator-app code at every sign-in.

12. Get help anytime

Click **Help & Support → New Ticket** from any page. Fill Subject, Description, Priority, Category, and optional attachments. Response time depends on priority selected; track ticket status from the Support page.

COMMON QUESTIONS (FAQ)

Q: Do I need a credit card to sign up? No — every account starts on the Free plan, no card required.

Q: I can't create my account — why? Your email must show the green "Verified" badge first. Click Verify, enter the 6-digit code, then submit.

Q: What's the difference between DNS TXT, Meta Tag, and File Upload verification? All three prove domain ownership; pick whichever is easiest for your team. DNS TXT is the default and doesn't require touching site files — good if your developer manages DNS but not the codebase.

Q: I don't have a domain yet — can I still explore Consiva? You can create an account and explore the dashboard, but adding/verifying a domain and installing the script require an actual live domain.

Q: Where does the script go? In your site's <head>, before any other tracking scripts, on every page.

Q: Does the banner need to be in a local language? For India-facing sites, DPDP Section 5(3) recommends offering the notice in English plus at least one Eighth Schedule language. Free plan includes English + Hindi; Pro/Enterprise unlock all 22.

Q: What happens after I click "Add Domain" — do I need to do anything else? Yes — you still need to (1) verify ownership, and (2) install the script. Adding the domain alone doesn't activate consent collection.

Q: How is form consent different from cookie consent? Cookie consent covers tracking/cookies (via the site-wide script + banner). Form consent covers PII collected in submissions (Contact Us, Enquiry, Chatbot) and needs its own script + field tagging, found under Consent Management → Get Script.

Q: How do I add a second team member? Not covered in this walkthrough — raise a ticket via Help & Support for account/team management questions.

TROUBLESHOOTING

Domain won't verify: 1. Confirm the TXT record (or meta tag/file) was published exactly as shown — no typos in Host or Value. 2. Wait a few minutes for DNS propagation before clicking Check Now again. 3. Use the “share these steps with your IT/dev team” option to have the exact values emailed directly to your developer. 4. Still stuck after 24-48 hrs → raise a support ticket.

Banner not showing on the live site: 1. Confirm the script is pasted in <head>, before other tracking scripts. 2. Confirm the domain shows as Verified in the dashboard (script won't activate on an unverified domain). 3. Clear cache/CDN cache and retest in an incognito window. 4. Check the Script Key/domain-ID in the snippet matches the one shown for that domain in-app.

Form consent not recording: 1. Confirm every PII input has data-cmp-pii="ColumnName" attribute. 2. Confirm the submit handler snippet (Step 2 of the Get Script dialog) is attached once, correctly referencing the form. 3. New fields added later just need the data-cmp-pii tag — no JS changes required; if it's still missing, check the tag was added to the right element.

Grievance Officer nudge showing on a verified domain: Go to Settings and fill in the Grievance Officer's name, email, and SLA — this clears the nudge and is a DPDP requirement.

Anything else / issue persists: Direct the user to **Help & Support** → **New Ticket**, with Subject, Description, Priority, and Category. Let them know response time depends on the priority selected, and they can track status on the Support page.

ESCALATION RULE

If the user's issue isn't resolved after 1-2 troubleshooting suggestions, respond with something like:

“This needs a closer look from our team. Please raise a ticket: **Help & Support** → **New Ticket** — include what you were trying to do and any error you saw. Response time depends on the priority you select.”
